WEL-COME

Project Name-
Water Purification Awareness

PROJECT BY-

1. ANURADHA JADHAV
2. OJAS KATE
3. POONAM KOKANE
4. SHRADHA KUMBHAR

Problem Statement-

Many ponds and water bodies contain polluted water due to waste disposal and lack of proper treatment. Such contaminated water can cause water-borne diseases and harm the environment.
In our selected water body (approximately **10 m × 10 m**), the water quality needs improvement. A natural, low-cost, and environmentally friendly solution is required to purify the water while maintaining plant survival during changing water levels.

Objectives-

- To improve the quality of polluted water using natural aquatic plants.
- To study the water purification ability of **Canna indica** and **Typhaangustifolia**.
- To develop a floating plantation system using coconut bark and soil.
- To spread awareness about safe drinking water and healthy practices.
- To promote an eco-friendly and sustainable method of water treatment.

Need of the Project-

- Water pollution is increasing every year.
- Many communities do not have access to clean water.
- Chemical treatment methods are expensive and require regular maintenance.
- Natural water purification is cost-effective and environmentally friendly.

Need of the Project -

- Aquatic plants absorb harmful pollutants and improve water quality.
- Floating plant systems can survive even when the water level changes.
- Community awareness is essential to reduce water-related diseases.
- This project promotes sustainable environmental conservation.

Methodology / Plan-

Step 1-

Visited the selected water body (10 m × 10 m) and surveyed the site.

Step 2-

Selected two aquatic plants:

- **Canna indica**
- **Typha angustifolia**

Step 3-

Visited a chemical laboratory and collected water samples from the site.

Step 4-

Planted the selected plants in the collected water samples and observed their growth for several days.

Step 5-

After healthy growth, the plants were transplanted into the selected water body.

Step 6-

To solve the problem of rising water levels, a floating platform was prepared using:

- Coconut bark (coir)
- Soil

This floating system helps the plants remain on the water surface and survive during water level fluctuations.

Step 7-

Visited nearby schools and created awareness about:

- Drinking boiled water
- Maintaining personal hygiene
- Conserving clean water

Expected Outcomes-

- Improvement in water quality through natural phytoremediation.
- Reduction in pollutants present in the water.
- Healthy growth of aquatic plants.
- Successful implementation of the floating plantation system.

- Increased awareness among students and the local community.
- Promotion of eco-friendly water purification methods.
- Better understanding of sustainable environmental practices.
- A low-cost model that can be replicated in other polluted water bodies.

Total Project Duration: Approximately 2 Months

Activity	Duration
Site Visit and Survey	Week 1
Laboratory Water Sample Collection	Week 1
Plant Growth Observation	Weeks 2–4
Floating Platform Preparation	Week 5
Plantation at Water Body	Week 6
Monitoring Plant Growth	Weeks 7–8
School Awareness Program	Week 8
Final Observation and Report	End of Month 2

Conclusion-

This project demonstrates that natural aquatic plants such as **Canna indica** and **Typha angustifolia** can effectively contribute to water purification. The floating plantation system made from coconut bark and soil ensures plant survival even when the water level increases. Along with environmental improvement, the awareness campaign encourages people to adopt safe drinking water practices and protect water resources.

Thank You..

"Clean Water, Healthy Life, Better Future."
